Rocket Propulsion Term Paper – Final Presentation Guidelines

At the **final** stage of the Rocket Propulsion term paper, each group is expected to address the following points in a clear, systematic, and technically sound manner:

1. **Rationale for Topic Selection:** Explain why you selected the particular topic and its relevance to rocket propulsion.
2. **Motivation and Significance:** Highlight the importance of the topic and its potential significance for future research, technological advancement, or practical applications.
3. **Current State of the Art:** Discuss the existing technologies, approaches, and recent developments related to your chosen topic.
4. **Identification of Research Gaps and Challenges:** Clearly identify the limitations of existing approaches and the key technical challenges that need to be addressed.
5. **Proposed Approach:** Present your proposed solution or approach to address the identified challenges. Explain how it differs from or improves upon existing approaches.
6. **Justification of the Proposed Approach:** Explain why you believe your proposed approach could work, supported by sound physical principles, scientific reasoning, relevant literature, or preliminary analysis.
7. **Theoretical and Computational Analysis:** Present any theoretical calculations, mathematical modelling, simulations, or computational analyses carried out to support your proposal. Clearly state the assumptions and limitations, wherever applicable.
8. **Expected Results:** Describe the anticipated outcomes of your proposed work and, wherever possible, quantify the expected improvements in performance, efficiency, reliability, cost, or other relevant parameters.
9. **Potential Impact:** Explain how your proposed work could address the identified challenges and contribute to advancements in rocket propulsion.

Note: The emphasis should be on critical thinking, technical understanding, and a well-justified proposal rather than merely compiling information from the literature. Any expected results should be supported by appropriate scientific reasoning or analysis, and should be clearly distinguished from results already demonstrated or validated.
